                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              proteins of the invention are either secreted or membrane-associated CC proteins and act as regulator of cellular proliferation and CC differentiation. SECX proteins or nucleotides are useful for diagnosing CC the presence of, or predisposition to, a disease associated with altered CC levels of SECX proteins and nucleotides. The SECX proteins are also CC useful to screen compounds that modulate SECX activity or expression. The interaction of a SECX protein with other cellular proteins may be useful to modulate the activity of a partner protein, cellular proliferation, CC cellular differentiation and cell survival. SECX nucleotides are useful CC for the recombinant expression of SECX protein, and may be used detect SECX mRNA or genetic lesions in the SECX gene. They may also be used to modulate SECX expression (e.g., using antisense oligonucleotides). SECX nucleic acid sequences are also useful for identifying a cell or tissue ctype in a biological sample, and in forensic biology. SECX primers or screening tissue cultures for contamination. Diseases that may be treated or prevented using SECX proteins or nucleotides include cancer (e.g., colorectal carcinoma, prostate cancer), benign tumours, immune diseases, transplant rejection, allergies, AIDS), infections, inflammatory disorders, arthritis, haematopoletic disorders, estenosis, restenosis, restenosis, surgical or traumatic wounds, spinal cord injury), and skeletal
                                                                                                                                                                                                                                                                                                                                                                                         Query Match

                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to a novel G protein coupling receptor, a gene encoding for the receptor family, a process for preparation of the receptor family, an antibody to the receptor family and a method for screening using the receptor. The invention be used for screening of agents expected to be useful for prevention and treatment of central nervous system (CNS) diseases. The present sequence the G protein coupling receptor.

orphan G protein-coupled receptor (GPCR), expressed in the spleen and C peripheral leucocytes. The hARE-1 cDNA was identified using EST (expressed sequence tag) 1689643 as a probe.
C (expressed sequence tag) 1689643 as a probe.
C The orphan GPCR of the invention, like all GPCRs has seven transmembrane calpha helices with an extracellular N-terminus and an intracellular C-terminus. However, no endogenous ligands has yet been identified for the proteins of the invention. The orphan GPCRs may be used in the identification of their endogenous ligands, and to screen potential GPCR may also be used in the study of GPCR-mediated signalling cascades, and C to elucidate their precise role in normal and diseased human conditions.
C Nucleic acid encoding human orphan GPCRs may be used for tissue localisation expression analysis to provide information about their function in healthy and pathological states.

                                                                                                                                                                                                                                    AAU10588
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes transmembrane receptors, preferably human G protein coupled receptors (GPCR), for which the endogenous ligand is unknown (orphan GPCR receptors). More specifically the present invention relates to non-endogenous, constitutively activated versions of a human GPCR. These non-endogenous human GPCRs can be useful for the direct identification of candidate compounds as receptors agonists, inverse agonists or partial agonists for use as pharmaceutical agents. AAA46017 to AAA46126 and AAB02825 to AAB02859 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 WPI; 20

                                                                              Ş
                                                                                                                                                                                                               밁
                                                                                                                                                                                                                                                                                                                                    The invention relates to the human HNEAA81 polypeptide and its associated DNA sequence. These sequences are related to the G-protein coupled receptor family. The HNEAA81 polypeptides are useful for treating bacterial, fungal, protozoal and viral infections, particularly infections caused by human immunodeficiency virus (HIV)-1 or HIV-2, pain, cancers, anorexia, bulimia, asthma, Parkinson's disease, acute heart failure, hypotension, hypertension, urinary retention, osteoporosis, angina pectoris, myocardial infarction, ulcer, allergies, benign prostatic hypertrophy, psychotic and neurological disorders (such as morety, schizophrenia, manic depression and dementia), delirium, severe mental retardation and dyskinesias (such as Huntington's disease and Gilles de la Tourette's syndrome). The polypeptides may also be used as research agents and material for the discovery of treatments and diagnostics for human and animal diseases, for screening compounds that bind to and activate the HNEAA81 polypeptides and for assessing the compounds characteristics, chemical libraries and natural product mixtures. This sequence represents the human HNEAA81 polypeptide.
                                                                                                                                                                                                                                                               Query Ma

GPCR is also referred as seven transmembrane receptor. G protein-coupled receptor protein is useful for treating neurological disorder, particularly schizophrenia. GPCR protein to is also useful for identifying compounds useful for treating treating the schizophrenia. These compounds are also useful for treating other the compounds are also useful for treating other treating the compounds are also useful for treating other and treating other treating ot

This sequence represents the mouse mHNEAA81 protein. The mouse mHNEAA81 protein is a member of the G protein-coupled receptor (GPCR) superfamily, and like all GPCRs, mouse mHNEAA81 has 7 putative transmembrane domains and is involved in signal transduction. In particular, mouse mHNEAA81 has homology to human KIAA001. The invention also relates to expression vectors and host cells comprising mHNEAA81 DNA, to recombinant expression of mHNEAA81, to drug screening methods that use mouse mHNEAA81 and to mHNEAA81 agonists and antagonists. Mouse mHNEAA81 nucleic acid sequences may be used to isolate cDNA and/or genomic clones encoding mHNEAA81 homologues or orthologues, particularly from other species, and may also be used to generate transgenic animals, including knockout animals, which may provide an insight into treating a variety of human disorders. Such disorders include bacterial, fungal, protozoal and viral infections, particularly HIV-1 or HIV-2 infections; pain; cancers; benign prostatic hypertrophy; diabetes; obesity; anorexia;

The coding sequence was isolated from a human neutrophil cDNA library and deposited as 75979. The coding sequence was subcloned into the vector pQE9 for expression in bacterial cells and pcDNAI/Amp for expression in COS The DNA is useful as a hybridization probe for a cDNA library to is the full length cDNA and to isolate other cDNAs which have a high sequence similarity to the gene or similar biological activity. It also useful for diagnosing by detecting diseases such as tumours ar cancers or susceptibility to diseases related to presence of mutati
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Polynucleotide encoding a G-protein coupass a hybridization probe for screening a polypeptide encoded useful for screening

The nucleotide sequence encoding GPR3 was isolated from human liver, kidney and pancreas. The invention relates to G-protein coupled receptor GPR2 (see AAZ60117) which has ATCC number 75976. The GPR2 polypeptide is used as part of a diagnostic assay for detecting diseases or susceptibility to diseases related to the presence of mutations in the GPR2 polypeptide. Examples of the diseases include tumours and cancers related to cell transformations. Nucleic acid sequences which specifically hybridise to probes.
